

Mosquito life cycle

Aedes aegypti

It takes about 7-10 days for an egg to develop into an adult mosquito.

If you see mosquitoes resembling *Aedes aegypti* contact:
Alameda County Mosquito Abatement District

National Center for Emerging and Zoonotic Infectious Diseases
Division of Vector-Borne Diseases

Life stages of *Aedes aegypti* and *Aedes albopictus* mosquitoes

Eggs

- Adult, female mosquitoes lay eggs on the inner, wet walls of containers with water, above the waterline.
- Eggs stick to container walls like glue. They can survive drying out for up to 8 months. Mosquito eggs can even survive a winter in the southern United States.
- Mosquitoes only need a small amount of water to lay eggs. Bowls, cups, fountains, tires, barrels, vases, and any other container storing water make a great “nursery.”

Larva

- Larvae live in the water. They emerge from mosquito eggs. This happens when water (from rain or a sprinkler) covers the eggs.
- Larvae can be seen in the water. They are very active and are often called “wigglers.”

Pupa

- Pupae live in the water. An adult mosquito emerges from the pupa and flies away.

Adult

- Adult female mosquitoes bite people and animals. Mosquitoes need blood to produce eggs.
- After feeding, female mosquitoes look for water sources to lay eggs.
- *Aedes aegypti* and *Aedes albopictus* don't fly long distances. In its lifetime, a mosquito will only fly within a few blocks.
- *Aedes aegypti* mosquitoes prefer to live near and bite people.
- Because *Aedes albopictus* bite people and animals, they can live near homes or in neighboring woods.
- Mosquitoes live inside and outside.
